

Virtual Project Management Consultant

Student: Sameer Karur

Goal: design and refine prompts so ChatGPT acts as a virtual PM consultant for planning, risk, collaboration, and performance tracking.

1. Domain and research

Domain: software / digital product delivery (Agile + hybrid). Tasks: planning, risk, team collaboration, performance tracking. Methods: Scrum, Kanban, PMI-style risk register, RACI, RAID, OKRs. Tool context: Jira/Linear, Confluence/Notion, Slack.

2. Scenarios

- * S1 Create a project plan
- * S2 Identify and manage risks
- * S3 Improve team collaboration
- * S4 Track project performance / exec status

3. Persona prompt (Aria)

Role-locked consultant with rules: limited clarifying questions, structured answers, weekly actions, explicit assumptions, frameworks without jargon, under 350 words, closing trio of next actions / watch-out risk / follow-up question.

4. Prompt iteration (initial vs refined)

Initial prompts were one-liners (How do I create an effective project plan?) and produced generic textbook answers. Refined prompts add role, context (team size, timeline, constraints), required output format (roadmap, RACI, tables, Markdown template), and length caps. This improved accuracy, relevance, and actionability.

5. Evaluation rubric (self-score after refinement)

Criteria: Accuracy 25%, Relevance 25%, Clarity 20%, Actionability 20%, Engagement 10%. After refinement, scenario totals were 24/25 (planning), 23/25 (risk), 24/25 (collaboration), 24/25 (performance).

6. Feedback incorporated

- * Risk answers needed owners -> Owner role column in S2.
- * Too long for busy PMs -> 300-350 word cap.
- * Want copy-paste artifacts -> Markdown exec template in S4.
- * Random follow-ups -> fixed closing trio.

7. Future improvements

Industry packs, persistent RAID war-room mode, second-model rubric judge, Jira/CSV status generation, multilingual variants.

8. Conclusion

Final prompt pack is reusable for live ChatGPT demos. Source notebook: Virtual_Project_Management_Consultant.ipynb.
